PWSID: OK1020902 **Date Notice Distributed:** November 2024

SERVICE LINE CONSUMER NOTICE:

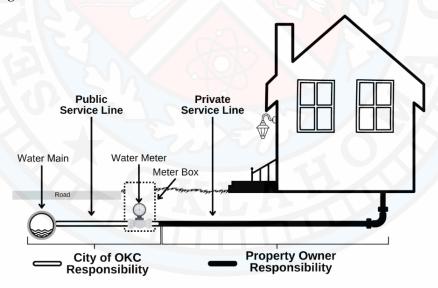

- 1. CONFIRMED <u>LEAD</u> SERVICE LINE (public) Review this letter for important information about lead in the *public* service line connected to your water meter.
- 2. CONFIRMED NON-LEAD SERVICE LINE (private)

AVISO AL CONSUMIDOR DE LÍNEA DE SERVICIO. Para revisar esta carta en español, visite okc.gov/leadsafe. DỊCH VỤ THÔNG BÁO NGƯỜI TIÊU DÙNG. Để xem lại bức thư này bằng tiếng Việt, hãy truy cập okc.gov/leadsafe.

__

The Oklahoma City Utilities Department (the City) is focused on protecting the health of every household in our community. This notice contains important information about your drinking water. Please share this information with anyone who drinks and/or cooks using water at this property. In addition to people *directly* served at this property, there may be others to share this information with, which can include people in apartments, nursing homes, schools, businesses, as well as parents served by childcare at this property.

As part of the U.S. Environmental Protection Agency (EPA) Lead and Copper Rule Revisions, the City must identify and inventory all public (City-owned) and private (owned by property owner) water pipes, called service lines, connected to the City's water distribution system. (Service lines are the small-diameter lines that connect on either side of the water meter. Refer to the graphic below.) Efforts to verify and inventory the lines began in the summer of 2023 using a variety of methods, including review of historical records and physical pipe inspections. The inventory is publicly available through our *Lead-Safe Community Database*. To view, go to https://okc.gov/leadsafe.

Not to scale. Graphic represents a typical scenario but does not represent all scenarios.

The public and private service lines used to carry water to a home can be made from, or contain, different materials. Review the table on the back of this page to learn about the material types we (the City) have confirmed for the public and private service lines your property is being served by.

Public service line	Private service line
Your property is being served by a LEAD SERVICE LINE . Lead can cause serious health problems, especially for pregnant women and young children. Please read this information closely to see what you can do to reduce lead in your drinking water.	Your property is being served by a NON-LEAD service line.
Replacement of the public lead service line:	
We are required to replace the public lead service line owned by the City and will be contacting you with more information on this replacement. Currently, our replacement timeframe for the public lead service line has yet to be determined. Please refer to the information listed under "Our next steps" for additional details.	

Our next steps

Under Oklahoma law, 11 Oklahoma Statutes §37-204, and the City's Municipal Code §55-43, the City is responsible for the *public* side of the service line and the property owner is responsible for the *private* side of the service line. We are currently developing a service line replacement plan to be published by the EPA's deadline of late 2027. Our plan will provide for the replacement of every *public* service line identified as lead. The timeline for our public service line replacements has yet to be determined. When finalized, the plan will be published online at https://okc.gov/leadsafe. When line replacement is scheduled for your service address, you will be given advance notice.

As part of the City's work, we are also updating and maintaining the service line inventory and working to identify service line material that has not been verified. The inventory will continue to be publicly available at https://okc.gov/leadsafe. Results are updated daily as work is completed.

Steps you can take to reduce your exposure to lead in your drinking water

Although we, as the public water system, are taking action to reduce lead levels, elevated lead levels may also be due to conditions unique to your home, such as the presence of lead solder or brass faucets, fittings, and valves that may contain lead. There are actions you can take to reduce exposure. We strongly urge you to take the following steps provided by the Oklahoma Department of Environmental Quality to reduce your exposure to lead in drinking water.

- Run your water to flush out lead. If water has not been used for several hours, run water for 30 seconds to 2 minutes until it becomes cold or reaches a steady temperature before using it for drinking or cooking.
- Use cold or bottled water for drinking, cooking, and preparing baby formula.
- DO NOT boil water to remove lead.
- Identify and replace your private plumbing fixtures that contain lead and/or lead solder.
- Install a point of use or point of entry treatment device certified to remove lead, such as a reverse osmosis filter.
- Replace your portion of the lead service line. (Important Note: As reflected in the table above, no replacement action is required on your part as the City is responsible for replacement of the *public lead service line*.)

To learn more about these and additional steps you can take, visit https://www.okc.gov/leadsafe and https://www.epa.gov/leadsafe and https://www.okc.gov/leadsafe and https://www.epa.gov/leadsafe.

Frequently asked questions

- 1. What are the health effects of lead? Exposure to lead in drinking water can cause serious health effects in all age groups. Infants and children can have decreases in IQ and attention span. Lead exposure can lead to new learning and behavior problems or exacerbate existing learning and behavior problems. The children of women who are exposed to lead before or during pregnancy can have increased risk of these adverse health effects. Adults can have increased risks of heart disease, high blood pressure, kidney, or nervous system problems.
- 2. Where does lead come from? Lead is a toxic heavy metal that occurs naturally. Though lead can be found in all parts of our environment, much of our exposure comes from human activities including the use of fossil fuels, some types of industrial facilities, and past use of lead-based paint in homes. Lead enters drinking water primarily through the corrosion, or wearing away, of materials containing lead in household plumbing and the water distribution system, such as the pipes that connect your house to the water main (service lines). Lead solder and plumbing fixtures, such as faucets, within your home/building may also contribute to lead in your drinking water.
- 3. **Does Oklahoma City have lead in its water supply?** No. The water treated and delivered from our two treatment plants does not contain lead. Additionally, no large pipes (water mains) within the City's water distribution system contain lead.

4. **Is it safe to drink water from service lines identified as lead or GRR?** The EPA has set the maximum contaminant level goal for lead in drinking water at zero because lead is a toxic metal that can be harmful to human health even at low exposure levels. As part of the City's treatment process, we take steps to reduce the potential for material in lead and galvanized lines to leach into drinking water, including using corrosion inhibitors. Oklahoma City's drinking water meets all Federal and State safe drinking water standards, which include those set forth by the EPA. However, there are additional steps you can take to reduce the likelihood of your exposure to lead, which are listed on our website as well as the EPA's website.

For more information, go to https://okc.gov/leadsafe. If you don't find the information you are looking for or have specific questions, contact us through email at leadsafe@okc.gov.

In our ongoing commitment to support public safety, know that the Oklahoma City Utilities Department is working diligently to uphold its high water-quality standards the community has counted on for decades.

Visit EPA's website at https://www.epa.gov/lead or contact your health care provider for more information on reducing lead exposure around your home/building and the health effects of lead.
