Storm Water Quality has monitored wet weather runoff data throughout the OKC since 2002. These data were reviewed to determine the priority sub-basins related to specific pollutant discharged during runoff conditions. Pollutant analysis included zinc, lead, oxygen demanding substances, and nutrients. Stations are prioritized by sample population and ranked by parameter median load values. The station data collected from a storm drain outfall near SW 12th and Lee is ranked as the highest priority sub-basin. Ultra-urban build out conditions in the 730 acre sub-basin often preclude the use of traditional surface level quality and quantity control practices such as surface detention. This proposal should be partnered with any flood alleviation factors planned for sub-basin and be promoted as a combined effort.	Downtown Drainage to the Oklahoma River	\$2,200,000	5	0
