

July is Smart Irrigation Month

July is typically the peak month for outdoor water use, so it's a good time to check your sprinkler system for leaks and broken sprinkler nozzles. At least twice a year, conduct a two-minute test of every zone on your irrigation system. Flag broken, misaligned, or problem sprinkler heads to make it easy for you to find the sprinklers once you turn the system off. Align sprinkler heads that are out of adjustment and fix any issues. Periodically watch for broken sprinkler heads and turn off your system until the problem is repaired.

Smart Irrigation Controllers

An automatic sprinkler system makes watering easy, but don't just set it and forget it. Adjust your schedule as plants become established, seasons change, and when it rains. Weather-based controllers or soil moisture sensors take the guesswork out of scheduling and water based on plant needs.

Consider replacing your existing sprinkler controller with a smart Wi-Fi controller that makes adjustments to the watering schedule based on the weather. Other great additions include soil moisture sensors and rain sensors. Look for a WaterSense® labeled controller to maximize water use efficiency in the landscape.
